## Instant setup (out of the box)

1. Upload **justified-image-grid.zip** to your WordPress installation in the admin area then click Activate. It's ready to use!  
The uploader is on the page /wp-admin/plugin-install.php?tab=upload
2. Open a post/page and make sure you have **images added to the post**.  
You can do so by clicking 'Upload/Insert' with an icon next to it.  
Do not click the 'Insert Gallery' button. If you already have the **gallery block / [gallery]** in the edit area of the page/post, just **delete** it.
3. Add this shortcode wherever you wish to see the grid: `[justified_image_grid]`  
You can also use the shortcode editor to insert it:  in the toolbar.  
That's all.

## Quick customize (using the presets)

1. Go to the plugin **settings page** under Settings -> Justified Image Grid.  
It's on the page /wp-admin/options-general.php?page=justified-image-grid
2. Click the buttons near the top of the page.  
These activate different settings to help you brainstorm.
3. Check if you like the effect by refreshing the post/page you added the shortcode to.  
Read further for more customizing.

Whenever you choose a preset, their settings will **set their own values below** the buttons. You can see all their settings in the settings sections, so feel free to modify what they set. You can't permanently **change** a preset.

## Detailed customizing from the plugin settings panel

1. Go to the plugin settings page under Settings -> Justified Image Grid.  
It's on the page /wp-admin/options-general.php?page=justified-image-grid
2. **Edit the settings** here. Use the contextual help or this document's settings reference.

3. Click the 'Save Changes' button at the bottom once you are done so you can check your post/page if you like the result.

**You can override** any setting on a per gallery basis in the editor of the posts/pages.

Setting any text input field to -1 will result in bringing back the default setting for that field. If you wish to reset everything to default, click the Preset 1 button.

## Customizing individual galleries by shortcode attributes

You can use the **shortcode editor** to override almost any setting you have set on the plugin page or in a preset.

1. Go to the post/page edit page.
2. Click on the Justified Image Grid shortcode editor icon: 
3. Add any setting you wish. **Only those that you touch** will be added to the shortcode. When you are done, click 'Insert shortcode' or 'Edit shortcode'.
4. **Save the page** (Update) and check that your post/page has different settings than you set on the plugin's settings page / or if you extended a preset successfully.

What extending a preset means: Choose a preset in the shortcode editor AND touch some settings below that. Your base setting will be the preset, but you'll **extend it** with your own choices. This applies when a preset is close to what you need but not exactly.

When going back to edit the shortcode, **please select it** before clicking on the icon! This will **load** all previous settings from that shortcode without having to start over. If you empty a setting or choose 'default', that attribute will be **removed** from the shortcode.

Manually:

The editor is for you convenience so that you don't need to 'code'. However, if you don't have the visual editor enabled you'll need to add the attributes and values manually. The **Settings reference** will be helpful in that case.

Just separate them with a space. You don't need to wrap everything in ' or " – except when you add multiple values like CSS margin "10px 0". This is only for the shortcodes, not the settings page. Make sure you **only use the available values** from the table in the Settings reference, with their accepted values.

## Settings reference

Presets	Shortcode attr.	Shortcode values	Description
Presets as shortcode	preset	1-9	You can choose a preset for each gallery individually. Any other shortcode attributes

attributes			you set will override that particular setting for the preset. None of the plugin settings will affect this gallery if you chose a preset within the shortcode. There are 9 presets.
<b>General settings</b>	Shortcode attr.	Shortcode values	Description
Height of the rows	row_height	a number (pixels), preferably between 100 and a few hundred	The script will target this row height. If you set no max deviation below, some <b>cropping will occur</b> from the sides of the images to maintain this row height at all times. Make sure <b>your images are at least this tall</b> to avoid upscaling.
Row height max deviation (+-)	height_deviation	Make it smaller than the row height, like half or quarter size. Set to 0 to have fixed height.	Give the script a chance to make images fit by growing or shrinking them <b>relative to the target row height</b> . If you set 200 as height and 50 as deviation, the rows will range from 150 to 250 in height. Rows with more <b>portrait</b> images will be <b>taller</b> ; rows with more <b>landscape</b> images will be <b>lower</b> .
Spacing between the thumbnails	thumbs_spacing	small number or 0	This is the space between each image. It's not added to the outside of the images.
Margin around gallery	margin	any CSS margin value	It's the space around the boundaries of the gallery. You can use CSS shorthand. E.g. "5px 0 10px 20px" which is "top right bottom left", respectively. Wrap it into ' or " when setting this with a shortcode attribute.
Animation speed	animation_speed	number in ms max advised: 1000 no animation: 0	Set the speed of all animation in milliseconds (300 for 0.3 sec, etc.) - it's for the initial fade-in of images upon loading, and for the <b>mouse over effects</b> .
Min height to avoid "jumping"	min_height	something around 1000	Set a number like 600 or 1200 <b>if you don't have a sidebar</b> and the footer appears before the gallery loads. This will make the gallery take up some space even before it's loaded. Don't set anything <b>higher</b> than the gallery unless you want that extra space!
Limit image count	limit	a number	You can set a <b>maximum number of images</b> to load. Max rows can limit this even further.
Max rows	max_rows	a number	Only display this many <b>rows</b> . Any other images will not be loaded. If you resize the window some images might not make it into the rows. If you maximize the window again they will be <b>re-added on the fly</b> . Use this setting if you wish to create a banner-like gallery block. Make sure you have enough images to fill the rows. Use 0 height deviation to create a <b>fixed height banner</b> .
Incomplete last	last_row	normal	You have complete control over what

row		hide match	happens when the last row seems to be incomplete. <b>Normal</b> means it'll try to fit the available width but if <b>it were too tall</b> (limited by the row height and height deviation), it'll just display as incomplete at the target height. <b>Hide</b> means it'll hide the last row if it's not complete (tries to fit the available width first). This ensures the <b>perfect justified block</b> every time. <b>Match</b> is special because it might not complete the row but visually it'll make it appealing if you have <b>images of the same shape</b> . It's used for a logo showcase or many landscape images (just an example). The last row will <b>mimic the previous row as much as possible</b> . If the images would not fit using the previous row's height, the plugin will find the optimal height to show a full row without cropping.
Order by	orderby	menu_order rand title_asc title_desc date_asc date_desc	Choose in which order the images should appear. The default, <b>menu_order</b> is the order you set in the gallery settings (by dragging & dropping).
Disable right mouse menu	mouse_disable	yes or no	This can protect your images from easy theft by disallowing the right click menu (including 'Save as...'). Choose yes if you want to disable the menu on right click.
Not available on the plugin settings page	id	a number	The ID of <b>another page or post</b> that has the attached images you'd like to use. Look for the post=5 in the URL bar (when editing other pages or posts). 5 is an example. This can be useful if you are attaching the same images to a different post, like in the preview page of this plugin. It's mandatory when using it in a <b>text widget</b> of the sidebar or as a <b>template tag</b> . Also if you wish to use <b>multiple instances</b> .
Not available on the plugin settings page	exclude	attachmend id's, comma separated	Use this to <b>exclude an image or images</b> from the gallery. The image needs to be among the images you were originally displaying. It only works for WordPress images. Go to the Media Library and mouse over the File names. Look at the status bar and note where the links point to. Find the <b>attachment id</b> (a number).
Not available on the plugin settings page	include	attachmend id's, comma separated	You can't use exclude and include together. Include means only these images will be displayed from the gallery.

Error checking	error_checking	yes no	This waits for all images to load or fail then <b>re-creates the grid without the unloadable images</b> . If you resize the browser window the list of unloadable images are preserved. If you set up <b>max rows</b> and there are <b>unused images</b> , it'll try to fetch those new images to compensate the loss of the unloadable images. However the image count <b>limit</b> is applied on the server side and it won't load more images (good or fail) than the limit you've set. It's vital to <b>keep this enabled</b> for production. You can disable it for testing. Errors are common on Facebook. If no images are displaying at all you have a different problem that this can't solve.
jQuery source	no shortcode attr.	-	Chances are your theme or a plugin on your site uses an old jQuery version. If you encounter errors you can use this settings to safely load the latest from Google. If google is down, it'll load the one from your WordPress installation or from the Plugin's folder.
jQuery load location	no shortcode attr.	-	Depending on how clean your site is and what quality plugins you use, you can try loading jQuery in the footer. In a perfect world, it'd be the most optimal for fast page loading, but it can break plugins. However, the option needs to be there just in case you need it.
<b>Lightboxes</b>	<b>Shortcode attr.</b>	<b>Shortcode values</b>	<b>Description</b>
Lightbox type	lightbox	prettyphoto colorbox custom no links-off	Choose what you would like to use. This is what happens when somebody clicks on the image. There are two built in scripts you can use. If your site <b>already uses one of these</b> , please select that option and add the link class and/or rel that your lightbox script is using to identify image links. Themes may customize their version of the lightbox scripts and it's best not to mix them with an original one from this plugin.
Link class(es)	link_class	one word	Anything you enter here will be added as class of the links on the images. This should only be used for the lightbox selector and <b>not CSS styling</b> unless you know what you are doing, of course.
Link rel	link_rel	like(this)	This makes lightbox scripts <b>group</b> images together so you can click <b>next/prev</b> buttons. Set to empty if you don't want that feature. WordPress doesn't allow square

			<p>brackets in the shortcode attributes but use parentheses and the plugin will <b>convert them to brackets</b> for you. Use brackets in the settings, however!</p> <p>Set it to auto for proper deeplinking support in prettyPhoto. It'll make this prettyPhoto[id] where the id is the instance number of your gallery. It's useful when you have multiple galleries on one page. If it's auto and you didn't choose prettyPhoto then it'll use colorBox[id] or none on the other settings. ColorBox doesn't have a deeplinking feature yet.</p>
Maximum size for lightbox (the image will link to this size)	lightbox_max_size	large full medium	WordPress creates these sizes when you upload an image. Even if your image is smaller, all of these will work. They'll default to the closest available. Don't use Full if you have large images, but use it if you specifically resized them to a web friendly size.
prettyPhoto JS settings	no shortcode attr.	-	<p>You can configure prettyPhoto with any of their JavaScript settings. The most fun is the theme setting. For more information check: <a href="http://www.no-margin-for-errors.com/projects/prettyPhoto-jquery-lightbox-clone/documentation/">http://www.no-margin-for-errors.com/projects/prettyPhoto-jquery-lightbox-clone/documentation/</a></p> <p>Please remove the last comma.</p> <p>Refer to the contextual help or the link for more information.</p>
ColorBox JS settings	no shortcode attr.	-	<a href="http://www.jacklmoore.com/colorbox">http://www.jacklmoore.com/colorbox</a>
WP field for link title (anchor tag's title attribute)	link_title_field	description title caption alternate	Lightbox plugins can behave differently in terms of where they <b>get the text from</b> as their title and (optionally) their description fields. The 4 options here are the WordPress fields you find when editing a picture's information. With this setting, you can <b>connect any of those fields</b> to the link's title attribute.
WP field for img alt (image tag's alt attribute)	img_alt_field	title description caption alternate	Same as the previous but you can pair a field to the image's alt attribute. For example, prettyPhoto gets the <b>title</b> on the top <b>from the img alt</b> attribute, and <b>description</b> below the image <b>from the link title</b> ... Colorbox <b>will not use</b> this field at all.
<b>Captions</b>	Shortcode attr.	Shortcode values	Description
Caption style	caption	fade slide mixed fixed	Set up how you'd like the image caption to appear <b>on the thumbs</b> . Different animation methods on mouse enter, fixed, and off.

		off	
Caption opacity	caption_opacity	0-1	<p>The opacity of the caption - <b>text and background combined</b>. Enter a number between 0 and 1. Value above 0.4 is recommended. 0 is fully transparent, 1 is fully opaque.</p> <p>If you want the <b>text to be opaque</b> but the <b>background transparent</b>, you'll need to set this to 1, and <b>apply rgba</b> in the <b>next setting</b> here.</p>
Caption background color	caption_bg_color	CSS colors, examples: white #000 #603C4D rgb(0,75,255) <b>rgba(0,0,0,0.3)</b>	<p>It's the color of the caption, <b>behind</b> the text. Any css color is accepted, like white or #000 or #603C4D or rgb(0,0,0) or even rgba(0,0,0,0.3). The <b>plugin makes rgba work</b> in IE7+ too (<b>only</b> for this setting)!</p>
Caption text color	caption_text_color	CSS color	<p>Sets the color of the text. Same values accepted as the previous setting <b>except rgba</b>.</p>
Caption title CSS	no shortcode attr.	-	<p>Set some basic things to the title, like text-align, font weight etc. Standard CSS only.</p>
Caption description CSS	no shortcode attr.	-	<p>Set CSS formatting for the longer text in the caption. Accepts standard CSS.</p>
WP field to use for title (main caption)	title_field	title description caption alternate	<p>Choose a WP field as title from the image details. Try something other than "Title" to only show those that you filled out, because Title is mandatory in WP and <b>you might not want to display a caption on all items</b>.</p>
WP field to use for caption (description)	caption_field	title description caption alternate	<p>Choose which WordPress image information field to use for the <b>description part of the caption</b>. It'll appear with smaller text by default, under the title.</p>
Text shadow	caption_text_shadow	As a whole: <b>1px 1px 0px black</b> (x, y, blur, color, respectively)	<p>Applies CSS text-shadow to <b>all text</b> in the caption. No IE! If used as a shortcode, wrap the value into " or '. This setting only makes sense if the <b>Caption opacity is 1</b>, and the background color is different from the shadow color. For the best results set the <b>Caption background</b> color to have some <b>transparency</b> with: <b>rgba(0,0,0,0.4)</b></p>
Color overlay	Shortcode attr.	Shortcode values	Description
Overlay type	overlay	others hovered off	<p>Select how you would like to see the color overlay. This is the solid layer that can <b>darken the images</b>. You can have it faded out on mouse enter, or only activate it on mouse enter, etc.</p>

Overlay opacity	overlay_opacity	0-1	Enter a value between 0 and 1.
Overlay color	overlay_color	CSS color	Any CSS color value is accepted. Avoid rgba.
<b>Desaturate</b>	Shortcode attr.	Shortcode values	Description
Desaturate method	desaturate	off others hovered everything	You can choose <b>on the fly</b> desaturation by JavaScript. The options should be self-explanatory.
<b>Facebook</b>	Shortcode attr.	Shortcode values	Description
App ID	no shortcode attr.	-	The App ID of the application you create on Facebook. It's only needed for users or restricted pages.
App Secret	no shortcode attr.	-	Both App ID and App Secret are needed together.
Facebook caching	facebook_caching	a number (minutes) default is 60, one hour	It's an additional call to request the list of images from Facebook, <b>before the images can start loading</b> . If you utilize this cache, the list is not needed from Facebook every single time, so your images will start loading faster. Do not rely on this too much for extended periods of time, as this is not intended to circumvent the access expiry (2 months). Set it to a few hours. If you change this setting, a new list is automatically requested on the next visit to the gallery (by anyone) so <b>you can't get stuck</b> by setting it too long. Use of this cache is <b>recommended</b> . If you wish to see album updates right away, set it to 0.
<b>TimThumb</b>	Shortcode attr.	Shortcode values	Description
TimThumb quality	quality	0-100	A value between 0 and 100 is required. 90 is usually good. You can set something lower for faster loading.
Custom TimThumb path (leave empty if unsure)	timthumb_path	absolute path (full URL)	If you already use TimThumb you can remove the plugin's version and point to <b>your TimThumb</b> here. That way you only need to update it one place.

## Facebook

It's possible to fetch images from Facebook albums. If you only want to load images from a company Facebook page that is **not restricted by age or location**, you are in luck because you are just a few clicks away from accomplishing that. Your setting will **never expire and you can set it and forget it**. In any other case it's still easy but also takes some preparation from your side to get it done.

The settings part

Refer to the detailed **contextual help** for more information. It's important to note that until you clicked the Save Changes button in the lower right corner, the changes are not saved! After filling out the App ID and App Secret, you need to Save so you can enable more functionality.

The **message log** will help you with error/success feedback of every action you make with the Facebook authorization tool.

### Adding a page

The input area is **inside the button**, and it accepts the page in **any format**. You can pass in the ID of the page, the page username (you have to pass the ID if the page doesn't have a username because it's not popular enough), or the full Facebook URL as it appears in your browser. Certain pages require users to be of a certain age or be in a specific country. For that you need to continue reading. You can't add users here.

### Adding a restricted page

When you add a **restricted page** you need to have a **human user authorized** already. If you only have one user, the page will try to access with that user. If you have more users you can select who would you like to access the page with. You'll be able to see who gave access to the page by the **via** label on the page's button. If you remove that user, the page will be removed too.

### Setting up a Facebook app

1. Go to [Facebook Developers](#).
2. If this is your first time being on this page, you might need to click "Allow".
3. Click "Create New App" in the top right corner.
4. In the "Create New App" dialog, enter an "App Name" that is relevant to your site, then hit "Continue".
5. You might need to complete a captcha security check and/or verify your Facebook account.
6. Under the "Website with Facebook Login" area, add your site beginning with http or https and ending with the domain, click "Save Changes" there.
7. Copy the "App ID" and "App Secret" fields to the appropriate fields below.
8. Click "Save Changes" here! You are done! Now you can add your profile or restricted pages.
9. To add yourself: Click "Add current Facebook user", then on Facebook click "Go to App". Done.

### Adding yourself or the logged in user / the user who logs in for you on your computer

Just click the **Add current Facebook user**, then click **Go to App** on Facebook. The access will expire after 2 months. To re-authorize you just have to click this button again, Facebook will

renew your access silently. **If the access expires, your gallery won't show restricted images from Facebook so it's advised to keep this in mind.** The plugin will alert you one week prior to expiration until you renew or remove your profile. It'll be a yellow administrator notice. It'll turn to red after the 2 months. The editors won't see as they can't do much about it. If you change your password, the access expires.

### Adding a 3rd party user profile

You can **ask someone else** to access their albums and display it on your site. They'll need to give permission of course. Send them the link from the input box. They'll be prompted for their basic info and photos which needs to be accepted. Upon success, a **key will be generated** that you'll need to **paste into the box in the settings**, then click **Add other user**. They'll be notified that their albums could be made public outside of Facebook. Their access will expire after 2 months as well. To renew, you need to complete this process again.

### Verifying the status of profiles or pages

When you have added pages and profiles, **just click them and the plugin will check if they are valid**, and whether you can get any albums from them. It also shows how much time is left until they expire and when they expire exactly.

### Removing profiles or pages

Just **click the X** next to those you wish to remove. You or the other user might want to revoke the access of the app on Facebook in the [app settings](#).

### The shortcode part

All your efforts in the settings page were made to let you **access the albums**. This is done **in the shortcode editor**. Open it and scroll to the Facebook section. You can see every profile and page you've added. Click one so you can see their albums. If you do not wish to use the Facebook feature just set it to Do not use Facebook or don't select an album.

### Adding an album

10 albums load with cover photo, the other cover photos are loaded on demand. This is to speed up things and reduce server load. Some popular pages have several hundred albums. They all load together up to 1000 albums. You can see the image count of each in the top right corner. The cover photo of an album can be loaded by hovering over it with the mouse briefly. If the photo can't load or the album turns out to be empty (or you don't have access to the album), the ability to select it will be gone. **Select an album that can load a picture**. For Wall Photos and other albums with many images **it's advised that you set a limit**. The limit is in the general settings. **Avoid loading a thousand pictures** if you can. **Use max rows and limit**

**together.** Once you chose an album just click Insert or Edit shortcode. The next time you edit it the **user/page will be selected** and the album will have the **blue frame around it** as well.

## Troubleshooting

Problem	Solution
<b>Nothing shows up</b> , not even the shortcode as the content.	Do you have <b>images attached to your post</b> ? If you don't have any, nothing will show up. Otherwise, you likely have made an error (typo) in one of the settings. Check if you have used any characters other than numbers in the fields that should only have numbers. Quick fix is to push one of the <b>preset buttons</b> that will reset all your settings to a working state. Also, try removing all attributes from the shortcode.
It's <b>only generating whitespace</b>	Click the link in the settings page, TimThumb section to check the permissions. Does it say writable? Follow the instruction there.  Otherwise, most likely it's still a TimThumb problem, and that's because your server setup is unusual. Isn't WordPress on the top level on your domain? Do you have something like yourdomain.com/~username/wp-content? In some cases, a bad configuration drives TimThumb (the 3 <sup>rd</sup> party image resizer script) crazy. It can't find the image on the server's filesystem. You'll need to create a timthumb-config.php file in the plugin directory with your path in it as: <pre>&lt;?php     \$_SERVER['DOCUMENT_ROOT'] = '/path/to/wordpress'; ?&gt;</pre> Contact me and I'll sort it out for you.
The <b>captions are not showing</b> , the <b>lightbox is not working</b> , and there is <b>no animation</b> on mouse over	Your site uses an old jQuery version. Go to the settings and select any other method for jQuery loading than the default one. It'll automatically load the latest jQuery for your site.
I can't see the grid but the <b>shortcode is visible</b> as the content.	Check if the plugin is <b>installed and activated</b> . It should replace the shortcode if it's activated. Check if you have made any typos in the shortcode. You can't use [] characters in the link rel using shortcodes. Use (). Don't separate the shortcode to multiple lines. You don't need to use ' ' characters in the shortcode - except for long values with spaces (CSS).
I would like to make an image in the gallery <b>link to something else</b>	The native WP Link URL in the media settings is buggy since a long time. It doesn't work for galleries too well. I added ' <b>Custom link for Justified Image Grid</b> ' for this purpose so please use that. The link class, rel, and lightbox will be turned off for this link and it'll open in the same tab/window.
I resize the window but the <b>gallery width is not adjusting</b>	You <b>need to have a liquid, full width</b> or at least a <b>flexible width page layout</b> defined <b>by your theme</b> . Try looking for a full width layout under the 'Template' in the 'Page Attributes' box on a page edit screen in the admin. The gallery will only resize if the width of its container element is <b>changed</b> . If it's in a fixed width div and you resize a nonresponsive site then it won't update itself.
The settings or a setting on the	Check if you have used shortcode attributes in the post/page because

plugin page is <b>not changing anything</b> about the gallery	those will always <b>override the plugin page settings</b> . Check typos!
The lightbox shows a wrong / <b>misplaced caption</b> .	With the link_title_field and img_alt_field settings you can set up which position in the lightbox gets which field from WP. You can even set all four fields to appear in your gallery. For example, <b>WP title</b> as the <b>main caption</b> on the thumbnail, <b>WP alternative</b> text as the <b>description</b> part of the thumbnail caption (caption_field). In addition, the <b>WP caption</b> can act as <b>one text in prettyPhoto</b> , then the <b>WP description</b> as the <b>other text</b> in prettyPhoto...
Some <b>images are missing</b> and/or the image won't load when clicked	<p>Sometimes WordPress fails to link to the image file, and only <b>links to the path</b> of the image. This might be because of a broken image. If you have used <b>rebuild thumbnail tools</b>, try using them again or <b>reuploading</b> the pictures. Try inserting the picture on its own to the post. If it still doesn't show then you should reupload that picture.</p> <p>Make sure error checking is on and you shouldn't see whitespace where images should load. If the big image can't load and you are serving them from Facebook there is nothing much you can do. Facebook sometimes fails to serve images, and most likely it's also missing if you go on Facebook directly and check it that way!</p>
The images are <b>not justified!</b>	<p>Check the row where it starts to go wrong: do you see an empty space to the left of an image that doesn't make sense? It's a sign that there is an image, which is broken. Make sure your uploaded images are error-free. If you have received HTTP ERROR during uploading to WP, then that's the cause. The images might appear in the media library but they can have missing metadata that is required for the plugin to work. (The dimensions of the image.) I received this kind of error when I had the smush it plugin enabled. It was crippling my uploads anyway so I disabled it.</p> <p>It is possible that your site's CSS is interfering with the gallery. Use browser debug tools like firebug or 'inspect element' features to screen these errors. Contact me if you are stuck.</p> <p>Do not add borders to the images with CSS.</p>
The <b>animation</b> is choppy.	<ul style="list-style-type: none"> <li>• Try reducing the amount of effects: use a fixed caption or just the fade effect.</li> <li>• Try disabling the overlay or the desaturation effects.</li> <li>• Try a different row height. If you have a lot of small images, disable the caption because it won't be readable anyway, this also reduces the animated elements.</li> <li>• Try turning off the animation while keeping the effects by setting animation speed to 0. Close the debugger tools (firebug etc.) because it runs slowly when they are open.</li> <li>• Try restarting your browser as it might have suffering because of the amount of tabs you opened during its run.</li> <li>• Close flash / HD videos playing in the background.</li> <li>• The mouse enter/leave handling has been optimized and should run smoothly on most modern computers. The animation runs above 30fps on a 5-year-old PC with lots of windows and tabs open at a time of testing.</li> </ul>
<b>Color images flash for a split</b>	It's normal, the browser needs to redo the desaturation of the changed

<b>second</b> when I resize the browser window (when I have desaturation on 'others' or 'everything').	image dimensions. Otherwise it's re-creating the grid because of skipping unloadable images.
The images are <b>not fading in</b>	It's a known error that happens in IE.
The caption <b>isn't sliding</b> but fading in and out.	In IE7 or lower the slide effect doesn't work. You can only apply sliding to the description, when the title is always visible. It's called 'mixed'.
<b>Tooltips appear</b> / don't appear when the mouse is over the images.	The plugin makes an effort to hide them. You should see no tooltips at all. IE7 and lower are not officially supported.
Mouse <b>hand cursor appears</b> as hand even though I turned off the clickability. / Mouse cursor doesn't appear as hand but it should.	Is this on IE7 or lower? Then that's why, sorry.
There is no <b>prev/next button</b> in the lightbox	Use link rel to group them together.
There is an <b>extra row in prettyPhoto's bottom caption</b> area	That's how it is when you disable the social tools for prettyPhoto.
Why does the TimThumb path have an <b>&amp;text=.extension</b> at the end?	That makes the images cacheable by CloudFlare. It doesn't hurt TimThumb that simply ignores it.
The <b>spacing between the images</b> is uneven	Have you zoomed in to the page? Please reset the browser zoom to 100%!
This doesn't work at all (I have an <b>AJAX</b> site).	It's not working in AJAX sites. The plugin relies on adding the script in the footer of a page it's actually needed on and is incompatible with AJAX based solutions.
There is <b>something weird with the overlay</b> / I can see my theme's overlay	Indeed your theme defines an overlay effect on the image links. I can help you remove that, just contact me. Otherwise try disabling the overlay of this plugin.
It's <b>not loading the plugin's version of prettyPhoto / ColorBox</b> (it's loading the theme's)	Please contact me so I can sort it out for you.
Liking the images in prettyPhoto doesn't like the image	It likes the gallery as a whole. It's possible to have individual liking but it's beyond the scope of this plugin and requires several changes on your site. Contact me for a custom job if you need this feature.
The <b>social tools don't share the individual pictures</b> (prettyPhoto)	Please enable deeplinking in the prettyPhoto settings

If the troubleshooting guide didn't solve your problem or you believe you have encountered a bug, please contact me here: <http://codecanyon.net/user/Firsh>

I reply to every E-mail, usually within a very short time. Most of the requests are answered in 10 minutes so check your mailbox soon after you have sent your question. You don't have to wait days. If you have a problem please let me help you and it'll be resolved.

Every bug report will be inspected. If fixed, the project will get an update (which is free via CodeCanyon). If you need help installing / setting up the script, (even after reading this documentation), please check if I'm available for a custom job. My technical support is limited to problems and questions related to the plugin.

## Updating

### With FTP access

1. Go to /wp-content/plugins/justified-image-grid/
2. Upload the contents of the justified-image-grid.zip there, overwrite everything
3. You can deactivate the plugin before this, and reactive after. I found this optional, but if you wish to do so, you can do it on the plugin page: /wp-admin/plugins.php

Your settings will be kept.

### Without FTP access

1. Deactivate the plugin
2. Remove it.
3. Upload the new version of justified-image-grid.zip just like you did in the 'instant setup'.

Your settings will be kept. This means the plugin won't remove its options from your database. It uses one option to store all values to minimize database clutter.

## Localization

1. Locate the languages/**jig\_td-LOCALE.po** file.
2. Make a copy and replace the LOCALE with your locale.  
For example, **jig\_td-es\_ES.po** for Spanish.
3. Download the Poedit software, and open the new file in it.
4. Translate the texts, and then save.
5. Upload it to /wp-content/plugins/justified-image-grid/languages
6. If your WordPress installation has **define('WPLANG', 'es\_ES');** in the wp-config.php you should see the translated text in the plugin.

## Template tag (footer or any other location)

You can put the gallery anywhere in your theme without a shortcode. The template tag behaves the same way as it accepts the **same parameters** and **can be generated** conveniently.

1. Set up a page **with a gallery**. You don't need to make the page publicly visible; it's just a place to arrange the pictures for your template tag gallery.
2. Look for the **ID in the URL bar** of your browser. It's like 5 at post=**5**, remember it.
3. Open the shortcode editor, **add the ID** to the ID field under the General settings.

4. Edit your other settings as you wish, then click on the **Generate template tag** button.
5. **Copy the tag** to a PHP file of your theme. If you are putting it inside `<?php ?>` already, just remove those.

If you insert the shortcode to the page, you can store these settings for later editing. Remember, you probably won't view this page directly so it doesn't matter if you insert the shortcode or not. I recommend doing so because you can go back, change one setting, and then regenerate the template tag.

**Instead of the ID you can also use Facebook.**

### In sidebar / as a widget

1. Follow template tag instructions above 1-3.
2. Edit your settings as you wish, then insert shortcode.
3. Select and copy the shortcode.
4. Drop a new text widget into your sidebar.
5. Paste the shortcode into it.

Note: This plugin makes your site support shortcodes in the text widget.

Thank you for purchasing this product! Please rate with 5 stars on the download page of your account on [CodeCanyon](#) if you liked it.

I recommend the free Shiba Media Library plugin that makes it easy to move image attachments between posts. It removes the burden of having to upload on the post page, so you can upload on the Media Library page and attach to or detach from posts anytime. It has a bulk mode, which is super helpful.

You can find it here: <http://shibashake.com/wordpress-theme/media-library-plus-plugin>
